

## Comparison of Sensipar® to Vitamin D Analogs and Phosphate Binders

End Stage Renal Disease (ESRD) results in a deficiency of biologically active Vitamin D. Clinical sequelae of this deficiency include low calcium levels, high phosphorus levels and high levels of a hormone produced by the parathyroid gland (PTH). This response by the parathyroid glands is called secondary hyperparathyroidism (HPT). Several types of medications may be used for the manifestations of secondary HPT, but these medications are in different drug classes, have different clinical effects, and are not equivalent.

To treat secondary HPT, most patients are prescribed a combination of medications from the classes shown in the table below. These types of medication are complementary and not equivalent or interchangeable. However, some are advocating that oral drugs with no intravenous (IV) equivalents that are used to treat the manifestations of secondary HPT, specifically calcimimetics and phosphate binders, should be included in the new bundled payment system for dialysis facilities as substitutes or “equivalents” for IV Vitamin D.

It would be clinically inappropriate for calcimimetics or phosphate binders to be treated as interchangeable substitutes to Vitamin D analogs or considered equivalents to Vitamin D analogs given the numerous differences between the drugs shown in the table below, including their active ingredients and their opposite effects on calcium and phosphorus levels. While a calcimimetic can treat some of the manifestations of secondary HPT, it cannot by definition, treat Vitamin D deficiency, i.e., low calcium levels, and cannot be considered a substitute for or equivalent to Vitamin D.

	Calcimimetics (Sensipar®)	Vitamin D Analogs	Phosphate Binders
<b>Current Medicare Benefit</b>	<ul style="list-style-type: none"> <li>▪ Never Part B</li> <li>▪ Covered by all Part D Plans</li> </ul>	<ul style="list-style-type: none"> <li>▪ Separately billable under Part B (IV formulation)</li> </ul>	<ul style="list-style-type: none"> <li>▪ Never Part B</li> <li>▪ Covered by Part D</li> </ul>
<b>Delivery<sup>1</sup></b>	<ul style="list-style-type: none"> <li>▪ Oral</li> <li>▪ Daily with a meal (therefore cannot be with dialysis)</li> </ul>	<ul style="list-style-type: none"> <li>▪ IV (most usage in dialysis) and oral</li> <li>▪ 3x per week with dialysis (most usage in ESRD) or daily</li> </ul>	<ul style="list-style-type: none"> <li>▪ Oral</li> <li>▪ Several times a day with meals (therefore cannot be with dialysis)</li> </ul>
<b>FDA-approved Indications<sup>2</sup></b>	<ul style="list-style-type: none"> <li>▪ Secondary HPT in patients with chronic kidney disease on dialysis</li> <li>▪ Hypercalcemia in patients with parathyroid carcinoma</li> </ul>	<ul style="list-style-type: none"> <li>▪ Secondary HPT in patients with chronic kidney disease on dialysis</li> <li>▪ Secondary HPT in patients with chronic kidney disease stages 3-4</li> <li>▪ Hypocalcemia in chronic kidney disease on dialysis</li> <li>▪ Hypocalcemia in post-surgical, idiopathic, and pseudo HPT</li> </ul>	<ul style="list-style-type: none"> <li>▪ Control of serum phosphorus in patients with chronic kidney disease on dialysis</li> <li>▪ Hyperphosphatemia in ESRD and does not promote aluminum absorption</li> </ul>
<b>Impact on Lab</b>	<ul style="list-style-type: none"> <li>▪ PTH: Decrease</li> </ul>	<ul style="list-style-type: none"> <li>▪ PTH: Decrease</li> </ul>	<ul style="list-style-type: none"> <li>▪ PTH: Decrease</li> </ul>

<sup>3</sup> The effect of phosphate binders on calcium levels varies, in particular calcium-based phosphate binders can increase calcium levels. This in turn also impacts the calcium x phosphorous levels.
